

MULTIMODE READERABSTRACT

5 An apparatus for analyzing a plurality of samples in
sample sites on a substrate, the apparatus having an array
of spaced apart light sources coupled to a moveable support
so that one or more of the light sources can be selectively
used; a frame for supporting the substrate; a detector
configured to detect light; an optical relay configured to
10 transmit light from at least one of the plurality of light
sources to a sample site and from the sample site to the
detector; and a support structure for supporting the frame,
the detector and the optical relay.
